Abstract

This is the abstract. It's probably the only part people will actually read.

Acknowledgements

This is where your acknowledgements go, because it's important to be nice. Usually thanking people like your supervisor, family, and those who read through your work is a good idea.

Contents

Abstract	iv
Acknowledgements	v
Table of Contents	vi
1 Background Chapter	1
1.1 A section	1
1.1.1 A subsection	1
2 New Material Chapter	3
3 Extras	5
3.1 Section With R Code	5
Bibliography	7

1 Background Chapter

This is chapter 1, which cites Chalmers (2012).

1.1 A section

Some text in a section new text.

1.1.1 A subsection

Some test in a subsection (probably as low as you need to go).

Equation example:

$$P(1|\theta, \phi) = \frac{1}{1 + \exp[-1.702 \cdot (\alpha_1 \theta_1 + \alpha_2 \theta_2 + \beta)]} \quad (1.1)$$

As can be seen in (1.1)...blah blah blah.

Alternatively, one can use L_YX macros to render equations with shorthand notation (define it in one location, but reference it globally). The below equation is generated

simply by opening a math environment and typing `\twoPL`.

$$\frac{\exp(\alpha + \beta\theta)}{1 + \exp(\alpha + \beta\theta)}$$

This correctly renders the equation in LyX , and puts the macro in with the standard $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ format (view the source code panel with **View** -> **Source** **Pane**). The macro itself was defined in an external file called `custom_macros`, and allows equations and such to be reused by other documents in the future. No more copy-and-pasting! Macros can also have optional and required inputs, like so $\frac{\exp(\alpha)^{20}}{1+\exp(\beta)^{30}}$, where the required inputs were left blank when first defined.

2 New Material Chapter

This is chapter 2, which also references Equation 1.1. References carry across documents because the master file (*york-thesis.lyx*) has two children: *chapter-1.lyx* and *chapter-2.lyx*.

Include figures and tables by placing them in “floating environments”. So for a figure, use **Insert -> Float -> Figure**, and then inside the generated box point to your external figure files with **Insert -> Graphics**. Labels are added with **Insert -> Label** and are references with **Insert -> Cross-Reference**.

Figure 2.1: My figure title

Figure 2.1 is an image of York University’s logo. Same thing is done for tables; use `Insert -> Float -> Table`, and then inside the generated box point to your external figure files with `Insert -> Table`.

4	5	6

Table 2.1: My table

3 Extras

3.1 Section With R Code

It is also possible to include R code directly by using the `knitr` module, and switching to LyX's ERT mode ("Evil Red Text" for raw \LaTeX code). First, open the master document and go to Document -> Settings -> Modules, find the module called Rnw (`knitr`), then select it and click Add; do the same for this file as well. This will make LyX know to Call R and use the `knitr` package. Next build an R chunk in ERT like so:

```
x <- rnorm(100)

head(x)

## [1] -1.831420 -0.009848 -0.865746 -0.790287 -0.850725  1.188178

hist(x)
```

Defining in-line calls to evaluated results from R is also possible with ERT; e.g., the first element of `x` was -1.8314 .

Figure 3.1: My histogram

Although I generally prefer to build figures outside of the document system (i.e., with an R script that can be changed later), for including code examples in the text or in an Appendix `knitr` can be useful.
